

# ENVIRONMENTAL DUE DILIGENCE

## WETLANDS:

Wetlands with the project area have been delineated. All potential impacts to these wetlands will be avoided by the site development and construction.

A stormwater management plan has been developed to manage stormwater during site operations and construction. The project will use an engineered stormwater collection, detention ponds, and other best management practices.

## RARE, THREATENED, AND ENDANGERED SPECIES:

The small footprint of the Project does not represent a significant loss of habitat and is unlikely to increase fragmentation in the area.

GlidePath's consultants worked with the U.S. Fish and Wildlife Service (USFWS) and the New York State Department of Environment & Conservation (NYSDEC) to identify the potential for sensitive wildlife to be present within the Project area.

The Project will prevent impacts to bats by only removing trees greater than 3" in diameter between November 1 and March 31 when the bats are in their hibernacula and unlikely to be active.

## ARCHAEOLOGY:

GlidePath completed testing to determine if any significant prehistoric or historic archaeology resources may exist within the Project site.

These studies determined that the site does not meet the requirements for inclusion in the National Register of Historic Places and, although some potential artifacts were discovered, the site is unlikely to provide any new information about prehistory.

**Full copies of each of the above studies is available on the Project's website ([www.LincolnParkGridSupportCenter.com/documents](http://www.LincolnParkGridSupportCenter.com/documents))**
